```
apiVersion: logging.openshift.io/v1
kind: ClusterLogging
metadata:
  name: instance
  namespace: openshift-logging
spec:
  collection:
    logs:
      fluentd: {}
      type: fluentd
    curator:
      curator:
        nodeSelector:
          node-role.kubernetes.io/infra: ''
        schedule: 30 3 * * *
      type: curator
    logStore:
      elasticsearch:
        nodeCount: 3
        nodeSelector:
          node-role.kubernetes.io/infra: ''
        redundancyPolicy: SingleRedundancy
        resources:
          limits:
            memory: 16Gi
          requests:
            cpu: 8
            memory: 16Gi
        storage:
          size: 500Gi
          storageClassName: MyBlockStorage
        retentionPolicy:
          application:

          audit:
            maxAge: 7d
          infra:
            maxAge: 7d
        type: elasticsearch
        managementState: Managed
        visualization:
          kibana:
            nodeSelector:
              node-role.kubernetes.io/infra: ''
            replicas: 1
        type: kibana
```

# Warum überhaupt?

- ▶ Diskspace der ElasticSearch Nodes wird knapp
  - ▶ Längere Behaltesdauer der Logs
  - ▶ Mehr Apps als ursprünglich erwartet
  - ▶ Debugging Logs in diversen Namespaces
- ▶ ElasticSearch/Logging Performance ist eingeschränkt
  - ▶ Watermarks werden erreicht
  - ▶ FluentD Queues steigen an
  - ▶ Kibana Views sind langsam bzw. verzögert
- ▶ **Verlust der Logdaten ist keine Option**

# Was man klassisch tut ...

- ▶ Redhat Knowledge Base-Artikel
  - ▶ <https://access.redhat.com/solutions/5233001>
- ▶ Redhat OpenShift Support
- ▶ Support verweist auf den KB-Artikel ... und täglich grüßt ...
  
- ▶ Logische Fehler, technische Hürden, Typos ...
- ▶ **Logging Operator verhindert manuelle Eingriffe!**
- ▶ Wissen über Cluster Systeme und ElasticSearch Resilienz
- ▶ Schritt für Schritt Weiterentwicklung
- ▶ Endergebnis
  - ▶ <https://access.redhat.com/solutions/6075191>

# Die Voraussetzungen ... zumeist Default

- ▶ 3-Node ElasticSearch Cluster
- ▶ Operator managed
- ▶ PVC Block Storage
- ▶ ElasticSearch redundancyPolicy != ZeroRedundancy
  - ▶ *SingleRedundancy*
  - ▶ *MultipleRedundancy*
  - ▶ *FullRedundancy*
- ▶ Die Grundlagen
  - ▶ <https://docs.openshift.com/container-platform/4.7/logging/config/cluster-logging-log-store.html>

# Anleitung – 101 Version

1. ClusterLogging ElasticSearch Storage Größe neu setzen

```
oc edit clusterloggings.logging.openshift.io instance -n openshift-logging
```

2. Elasticsearch Instanz stoppen

```
oc scale deployment elasticsearch-cdm-<HASH>-X --replicas=0 -n openshift-logging
```

3. Entsprechendes Storage entfernen

```
oc delete pvc elasticsearch-elasticsearch-cdm-<HASH>-X -n openshift-logging
```

4. Neuerstellung des Storages mit neuer Größe durch Operator abwarten

5. Elasticsearch Instanz starten

```
oc scale deployment elasticsearch-cdm-<HASH>-X --replicas=1 -n openshift-logging
```

6. Überwachung des Elasticsearch Clusters: 100% Verfügbarkeit bzw. Status **GREEN**

7. Zurück zu Schritt 2 für die nächste Elasticsearch Instanz

8. Fertig = alle Elasticsearch Instanzen wurden sequenziell gestoppt, Storage gelöscht und wieder gestartet.

# Die Grundlagen ...

```
$ oc project openshift-logging
```

Now using project "openshift-logging" on server "https://api.ocp.yourdomain.com:6443".

```
$ oc get deployment -l component=elasticsearch
```

NAME	READY	UP-TO-DATE	AVAILABLE	AGE
elasticsearch-cdm-<HASH>-1	1/1	1	1	26h
elasticsearch-cdm-<HASH>-2	1/1	1	1	26h
elasticsearch-cdm-<HASH>-3	1/1	1	1	26h

```
$ oc get pod -l component=elasticsearch
```

NAME	READY	STATUS	RESTARTS	AGE
elasticsearch-cdm-<HASH>-1-76bbd48d8c-tlgqq	2/2	Running	0	52m
elasticsearch-cdm-<HASH>-2-675947f7d4-vfk24	2/2	Running	0	39m
elasticsearch-cdm-<HASH>-3-795d4dc9c-dnwc4	2/2	Running	0	25m

```
$ oc get pvc
```

NAME	STATUS	VOLUME	CAPACITY	ACCESS MODES	STORAGECLASS	AGE
elasticsearch-elasticsearch-cdm-<HASH>-1	Bound	pvc-5e6de991-16f3-442d-b803-2222332294ed	95368Mi	RWO	thin	54s
elasticsearch-elasticsearch-cdm-<HASH>-2	Bound	pvc-32000594-0b35-45ea-888e-ba726642e45e	95368Mi	RWO	thin	25h
elasticsearch-elasticsearch-cdm-<HASH>-3	Bound	pvc-06189790-6alb-4177-b0e7-5b302acdf4b8	95368Mi	RWO	thin	25h

# Schritt 1 – Das Storage anpassen ...

```
$ oc edit clusterloggings.logging.openshift.io instance
spec:
[...]
logStore:
  elasticsearch:
    nodeCount: 3
    nodeSelector:
      node-role.kubernetes.io/infra: ""
  redundancyPolicy: SingleRedundancy
storage:
  size: 200Gi
  storageClassName: MyBlockStorage
```

# Schritt 2 - Das Kochrezept ...

```
$ oc scale deployment elasticsearch-cdm-<HASH>-X --replicas=0
deployment.apps/ elasticsearch-cdm-<HASH>-1 scaled
```

```
$ oc delete pvc elasticsearch-elasticsearch-cdm-<HASH>-X
persistentvolumeclaim "elasticsearch-elasticsearch-cdm-<HASH>-1" deleted
```

```
$ oc get pvc
```

NAME	STATUS	VOLUME	CAPACITY	ACCESS MODES	STORAGECLASS	AGE
elasticsearch-elasticsearch-cdm-<HASH>-1	Bound	pvc-5e6de991-16f3-442d-b803-2222332294ed	143052Mi	RWO	thin	54s
elasticsearch-elasticsearch-cdm-<HASH>-2	Bound	pvc-32000594-0b35-45ea-888e-ba726642e45e	95368Mi	RWO	thin	25h
elasticsearch-elasticsearch-cdm-<HASH>-3	Bound	pvc-06189790-6alb-4177-b0e7-5b302acdf4b8	95368Mi	RWO	thin	25h

```
$ oc scale deployment elasticsearch-cdm-<HASH>-1 --replicas=1
deployment.apps/ elasticsearch-cdm-<HASH>-1 scaled
```

```
$ watch oc exec -c elasticsearch elasticsearch-cdm-<HASH>-1-<PODId> -- es_util --query=_cat/health?v
Tue Jun 29 14:55:29 UTC 2021

- ▶ <https://gist.github.com/toughIQ/ae299dd8ac4dffed4387c92f89bdf5a8>

# Fragen und Antworten ...

- ▶ Eure Fragen ...
  - Bitte gerne alles und jederzeit
- ▶ Themen, die ich anregen kann:
  - Warum *kann* die originale Redhat Lösung nicht funktionieren?
  - Mögliche Lösung für Multi-Node mit ZeroRedundancy?
  - JSON Logging
  - OpenShift 4.8 und 4.9 (Stichwort APIs)
- Welche Dance-Moves sind gerade auf TikTok aktuell?

**Vielen Dank für eure Aufmerksamkeit!**
